I am using win7 64 bit and can't connect wirelessly. I have tried a few things like:

1. Make sure the wireless network adapter is configured correctly. Windows can be used to configure the wireless settings by starting the Wireless Zero Configuration service.

2. Check if the Wireless Zero Configuration service is running. You can start it using Services.msc.

3. If the service is running, try restarting your computer.

4. If the problem persists, try updating your drivers.

5. Use the Lenovo Wireless Test tool to check if your network adapter supports the Wireless Zero Configuration service.

6. If you are running Windows 8 or newer, you may need to adjust the Zero Configuration settings to support 802.x Authentication.

7. If you are running Windows XP, SP2, you may need to manually configure your connection settings.

Windows XP automatically scans for available wireless networks. If your network adapter does not support the Wireless Zero Configuration service, you may need to use the Network Connections utility to configure your connection settings.

If you are running Windows 7, these adjustments will not need to be made on machines running Windows 7.
